Title: Description: Perfect Score: Sequence:

PAM 150 Gap 11 Scoring table:

77977 seqs, 28268293 residues Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

swiss-prot37 1:swissprot Database:

Mean 56.586; Variance 121.726; scale 0.465 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No.	9.74e-17	9.74e-17	7.91e-18	1.17e-15	1.67e-15	1.99e-16	5.77e-16	8.23e-16	2.84e-16	9.70e-15	3.93e-14	4.81e-15	7.89e-14	1.96e-14	2.23e-13	1.25e-12	3.15e-13	1.25e-12	1.76e-12	3.49e-12	1.58e-13	1.76e-12	1.76e-12

PEROUENCE FROM N.A.

ANTONIOU B., SMITH A., ELLIOTT G., KRAMER J.;
C. I. FUNCTIONS THE AH RECEPTOR ACTIVATED IN ASSOCIATION WITH A LIGAND
C. IS CONSIDERED TO TRANSLOCATE FROM CYTOPLASM TO NUCLEUS AND
C. ENFENCE OF PALGOGRAPIED AROMATIC. HYDROCARRONS.
C. SEQUENCE IN THEIR PROMOTER REGIONS. IT MEDIATES BIOCHEMICAL AND
C. TOXIC EFFECTS OF HALGOGRAPIED AROMATIC, UPON BINDING WITH LIGAND
AND INTERACTION WITH A HSP90, IT TRANSLOCATES TO THE NUCLEUS.
C. SUBULITY: EFFICIENT DNA BINDING REQUIRES DIMERIZATION WITH AN OTHER BHILH PROTEIN. IN THE NUCLEUS, HETERODIMER OF AHR AND ANNI.
C. STMILARITY: CONTAINS A PAS (PER ARNIT SIM) DIMERIZATION DOMAIN.
C. STMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. EURMITTED (JAN-1994) TO BEBL/GENBANK/DDBJ DATA BANKS.

SUBMITTED (JAN-1994) TO BEBL/GENBANK/DDBJ DATA BANKS.

IS CONSIDERED TO TRANSCLETE FROM CYTOPLASM TO NUCLEUS AND ENTANCE THE TRANSCRIPTION OF THE GENES BY BINDING TO THE XRE SEQUENCE IN THEIR PROMOTER REGIONS. IT MEDIATES BIOCHEMICAL AND TOXIC EFFECTS OF HALOGENATED AROMATIC HYDROCARBONS.

SUBJECTIOLIAR LOCATION: FIRST CYTOPLASMIC, UPON BINDING WITH LIGAND TOXIC SEPECTION WITH A HSP990, IT TRANSCROARSONS.

TISSUE SPECIFICITY: EXPRESSED AT HIGHER LEVELS TO THE NUCLEUS.

TISSUE SPECIFICITY: EXPRESSED AT HIGHER LEVELS IN THE LUNG > THYMUS > KIDNEY > LIVER. LOWER LEVEL SEEN IN HEART AND SPLEEN.

SUBJECTION WITH AN BINDING REQUIRES DIMERIZATION WITH AN OTHER BHIT PROTEIN. IN THE NUCLEUS, HETREROPHMER OF AHR AND ARNT.

SHILLARITY: CONTAINS A PAS (PER-ARNT-SIM) DIMERIZATION DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. INTERCALARY AND MANDIBULAR SEGMENTS OF THE HEAD.
DEVELOPMENTAL STAGE: FIRST EXPRESSED IN A STRIPE COVERING THE HEAD
ANLAGEN OF THE SYNCITIAL BLASTODEME MEMRYO, PERSISTS THROUGH
GASTRULATION AND DECAYS DURING GERM BAND EXTENSION. EXPRESSED
LATER IN DEVELOPMENT IN A COMPLEX SPATIALLY RESTRICTED PATTERN.
SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SACCHAROMYCES CEREVISIAE (BAKER'S YEAST).

J. BIOL. CHEM. 260:8203-8213(1985).
-!- FUNCTION: GLIADIN IS THE MADOR SEED STORAGE PROTEIN IN WHEAT.
-!- THE ALPHA/BETA-GLIADINS CAN BE DIVIDED INTO 5 HOMOLOGY CLASSES.
SEQUENCE DIVERGENCE BETWEEN THE CLASSES IS DUE TO SINGLE BASE SUBSITUTIONS AND TO DUPLICATIONS ON PELETIONS WITHIN OR NEAR DIRECT REPEATS. THERE ARE MORE THAN A 100 COPIES OF THE GENE FOR ALPHA/BETA-GLIADIN PER HAPLOID GENOME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TRITICUM AESTIVUM (WHEAT).

"CONSERVATION AND VARIABLIST J.A., SUGIYAMA T., STOLL M., SOELL D.;
"CONSERVATION AND VARIABLISTY OF Wheat alpha/Deta-gliadin genes.";
NUCLEIC ACIDS RES. 13:3905-3316(1985).

-I- FUNCTION: GLIADIN IS THE MAJOR SEED STORAGE PROTEIN IN WHEAT.

-I- THE ALPHA/BETA-GLIADINS CAN BE DIVIDED INTO 5 HOWOLOGY CLASSES.
SEQUENCE DIVERGENCE BETWEEN THE CLASSES IS DUE TO SINGLE BASE SUBSTITUTIONS AND TO DUPLICATIONS OR DELETIONS WITHIN OR NEAR DIRECT REPEATS. THERE ARE MORE THAN A 100 COPIES OF THE GENE FOR ALPHA/BETA-GLIADIN PER HAPLOID GENOME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

INVOLVED IN SPECIFIYING SENSORY OFGAN IDENTIFY IN DISSIPLIAL.

-I- FUNCTION: REGULATOR OF CELL FATE DECISIONS IN MULTIPLE LINEAGES.
-I- FUNCTIONS AS A DETERMINATION FACTOR THAT SPECIFES SENSORY ORGAN IDENTITY IN PRECURSOR CELLS. PROBABLY ALSO INVOLVED IN CELL TYPE SPECIFICATION OF MALPIGHIAN TUBULES. IN ABSENCE OF COLUMN CELL TYPE SENSORY ORGANS ARE TRANSFORMED INTO CHORDOTONAL
                                                                                                                                                                                                                                                                                                              TISSUE SPECIFICITY: DETECTED IN MANY CELLS IN THE CENTRAL NERVOUS SYSTEM, ALL EXTERNAL SENSORY ORGANS, SOME PERIPHERAL NEURONS, AND IN THE NON-NEURAL CELLS OF THE SPIRACLES AND THE MALPIGHIAN
                                                                                                                                                                                                                                                                                                                                                                             DEVELOPMENTAL STAGE: CELL-SPECIFIC PATTERN OF EXPRESSION. BROADLY
                                                                                                                                                                                                                                                                                                                                                                                         EXPRESSED DURING EMBRYONIC DEVELOPMENT.

Patent No. 5834183
GENERAL INFORMATION:
APPLICANT: Corr, Harry T.
APPLICANT: Ranum, Laura P.W.
APPLICANT: Cophil, Huda Y.
TITLE OF INVENTION: Gene Sequence for Spinocerebellar;
Patent No. 5834183
TITLE OF INVENTION: Type I and Method for Diagnosis;
NUMBER OF SEQUENCES: 85
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          COMPUTER READABLE FORM:

Patent No. 5834183
CENERAL INFORMATION:
CENERAL INFORMATION:
APPLICANT: Ranum, Laura P.W.
APPLICANT: Chung, Ming-y1
APPLICANT: Zoghbi, Huda Y.
TITLE OF INVENTION: Gene Sequence for Spinocerebellar Ataxia
Patent No. 5834183
TITLE OF INVENTION: Type 1 and Method for Diagnosis
NUMBER OF SEQUENCES: 85
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The AIBI protein is a member of the steroid receptor coactivator-1 (SCR-1) family of nuclear receptor co-activators that interact with estrogen receptors (ER) to enhance ER-dependent transcription.

The AIBI gene is amplified and over-expressed in certain cancers in particular breast cancer and steroid hormone responsive cancers.

The AIBI polypeptide can be used to identify compounds which inhibit ER-dependent transcription. Increased expression of the AIBI gene or an increase in the number indicates aberrantly proliferating cells, thus detection of increased expression of the AIBI gene or an increase in the number of copies of the AIBI gene can be used to diagnose cancer or a predisposition towards developing cancer. Compounds which inhibit expression of AIBI or compounds which inhibit interaction of AIBI cancer calls. This sequence is of the multine pcIP gene, a mouse orthology faIBI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          117
